Create New Model (Model Builder)

- Right-click on a toolbox you have created (see ‘Create New Toolbox’ instructions in the LibGuide), and select New ➔ Model…

A new model window will open. Drag a tool you wish to use into the Model from ArcToolbox.
Double-click the square box containing the tool and define the parameters.

If done correctly, the model will now be in color and will reflect input and output data parameters.
You may add additional tools, using output from early tools as input for later tools. When ready to execute your model you may run each tool individually (in order, right-click, select Run), or by choosing to Run Entire Model.

Model Properties may be updated by selecting Model→Model Properties. Remember the importance of ‘relative path names’ (see NU ArcMap Tips and Tricks) before saving.
